721 Spectrophotometer Detector

Overview

721G/722G visible spectrophotometer enables quantitative and qualitative analysis of samples within the visible spectrum. It can be widely used in pharmaceutical manufacturing, health, clinical tests, biochemistry, petrochemical industry, environmental protection and quality control fields. The grating disperses the light beam to produce the spectrum, a portion of which is focused on the exit slit of the mono-chromator by. The holographic blazed grating monochromator has the advantages of high wavelength accuracy, good monochromaticity and low stray light. Linear regression method and coefficient method are added to the concentration test method. 0% T and 100% T, concentration factor setting and concentration direct. This document provides detailed information about the principles, uses, and characteristics of the 721/721N visible spectrophotometer.

721 Spectrophotometer

Upon leaving the sample compartment, the beam is passed to the silicon photodiode detector and causes the detector to produce an electrical signal that is displayed on the digital display.
