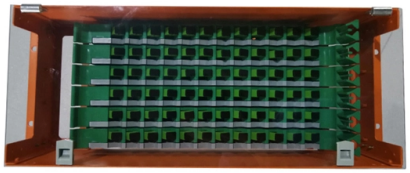
LC optical switch enables communication



Overview

Liquid crystal (LC) technology enables optical switching with low insertion loss (IL < 6 dB) and excellent uniformity. LC switches operate efficiently in bandwidth-demanding applications like optical add/drop multiplexing and protection networks. We propose a three-dimensional (3D) integrated optical switch that leverages liquid crystal (LC) birefringence to achieve reconfigurable light routing for particular suitability for quantum optical communication. In our design, the large refractive index contrast between an LC's ordinary (no) and. The paper discusses the growing demand for bandwidth in telecommunications, necessitating the use of optical switches for efficient data transmission without electrical conversion.
