Application Cases of Wavelength Division Multiplexing

Overview

Wavelength division multiplexers are fundamental to the functioning and performance of integrated photonic circuits, with applications ranging from optical interconnects to sensing and quantum technologies. In fiber-optic communications, wavelength-division multiplexing (WDM) is a technology which multiplexes a number of optical carrier signals onto a single optical fiber by using different wavelengths (i. This co-optimized platform enables efficient routing of multiple light signals across different wavelengths. Corning's R&D scientists are constantly searching for new ways to improve wavelength division multiplexing (WDM) technology. Close collaboration with our customers and our proven expertise across fiber, cable, and connectivity ensure you'll get solutions that are smarter, denser, faster, and easier.
