Belarusian Distribution Box Armored Installation Scheme

Overview

Electrical DB, SMDB, and MDB Installation Guide The document provides a method statement for installing electrical distribution boards (DB), sub-main distr.

Key Takeaways

Belarusian armored distribution boxes are modular, factory-sealed units designed for secure power and signal distribution, integrating armored cabling, bus systems, and compliance with international standards.

Overview

Belarusian distribution boxes, supplied by companies such as Blazing Electric Co., Ltd. in Minsk, are designed to house electrical meters, fuses, switchers, isolators, and other control devices. They are suitable for both indoor and outdoor installations and can be customized for power, signal, and data distribution. Armored versions provide enhanced protection against mechanical damage and environmental hazards.

Construction and Materials

Enclosures: Typically made from thermoplastic, impact-resistant materials, fiberglass-reinforced polyester, or stainless steel, ensuring resistance to chemicals and physical impact. Modular Design: Components are arranged in modular sections, allowing easy expansion or replacement without altering the main structure. Sealed Units: Armored boxes are factory-sealed to comply with standards such as BSEN 61535: 2009, ensuring safe permanent connections in fixed installations.

Installation Scheme

Mounting: Boxes can be wall-mounted or installed on dedicated stands, enabling integration into larger switching systems. Power Distribution: High and low voltage systems can be configured in ring or radial layouts. From the Master Distribution Box (MDB), extender cables connect to fuse spurs or Tee points, which then feed devices like fan coil units (FCUs).

Signal and Data Integration: A BUS cable (shielded STP or unshielded UTP) can be integrated for lighting or power control, connecting to Light Control Modules (LCMs) or Building Management Systems (BMS). Data distribution cables may run separately or be integral to the MDB, depending on project requirements. Cable Entry: Ex-certified cable glands are used for armored or non-armored cables, ensuring safe connections to machinery or equipment.

Component Arrangement: Buttons, control lights, connectors, and terminals are configured according to the customer's technical specifications. Pilot lights and meters are installed behind thermoresistant glass windows for durability.

Safety and Standards

Compliance with IEC 60364 and other international electrical standards ensures safe and energy-efficient installations. Armored boxes prevent mechanical damage, unauthorized access, and environmental hazards, critical for industrial or outdoor applications. All components are certified and replaceable, allowing maintenance without compromising safety.

Cost Considerations

Pricing depends on panel amperage, indoor vs outdoor location, wiring length, and system complexity. Modular and armored designs may increase initial costs but provide long-term reliability, scalability, and reduced maintenance.

Summary

Belarusian armored distribution boxes are modular, secure, and compliant with international standards, integrating power, signal, and data distribution. The installation scheme involves wall or stand mounting, modular component arrangement, armored cable entry, and optional BUS integration for lighting or BMS control. Proper installation ensures safety, durability, and flexibility for industrial, commercial, or smart building applications.
