Can optical modules transmit electricity

Overview

Optical fibers or fiber cables can be used for transmitting optical power from a source to some application. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. As an important part of fiber-optic communication, an optical module is a photoelectric converter which converts electrical signals into optical signals and vice versa. An optical module works at the physical layer of the OSI model and is one of the core components in the fiber communication. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. With each generation, they deliver higher data rates, such as 100 Gbps, 400 Gbps, and soon 800 Gbps.
