Bridge Construction Notes

Overview

Bridges are key parts of transport networks, linking roads, railways and highways efficiently. Bridge engineering is a fundamental and specialized branch of civil engineering that focuses on the design, analysis, construction and maintenance of bridges. Students are assumed to be proficient in the material taught in the following courses offered in the BSc in Civil Engineering at ETH Zurich (or have acquired equivalent. □ Bridge is a structure having an opening not less than 6000 mm that forms part of a highway or over, or under which the highway passes. Structures having span less than 6000mm are culverts. It controls the capacity of the system. This article breaks down bridge construction techniques. The document outlines various methods and types of bridge construction, including cast-in-situ, incremental launching, and precast methods.
