Cable tray clamping spacing

Overview

Cable Tray Technical Guide A practical guide to product selection and. As per the NEC, the maximum allowable rung spacing is 9 inches (230 mm) when cable.

Key Takeaways

Cable tray clamping spacing depends on tray type, cable load, and orientation, with typical horizontal rung spacing of 150–230 mm and vertical support intervals adjusted for cable weight and length.

Horizontal Runs

For horizontal cable tray runs, rung spacing is generally recommended between 6 to 9 inches (150 to 230 mm), especially for instrumentation and control cables that require additional support and protection. Supports or clamps should be installed at regular intervals to prevent sagging, maintain cable alignment, and allow proper heat dissipation. At bends, supports should be placed on either side to maintain the minimum bending radius of the cables.

Vertical Runs

Vertical cable tray runs require special attention to prevent excessive tension on cables. For runs exceeding 32 meters, strain relief sections should be incorporated, typically by offsetting the cable by at least 2 cable diameters per section. For very long vertical runs (over 100 meters), additional tension-relieving measures, such as short horizontal offsets of at least 1 meter, are recommended to avoid straight vertical stress.

The vertical spacing of supports may differ from horizontal spacing and should follow manufacturer or standard guidelines.

Clamping and Support Considerations

Hanging rods for tray supports should be at least 8 mm in diameter to ensure stability. Clamps or supports should maintain cable order, prevent shifting, and allow for maintenance access. For flexible systems (e.g., J-hanger installations), calculations may be required to determine spacing to achieve acceptable deflection or offset.

Proper spacing also reduces electromagnetic interference, prevents fire hazards, and ensures structural integrity.

Summary

Horizontal rung spacing: 150–230 mm (6–9 inches)Vertical support spacing: Adjusted based on cable length, weight, and strain relief requirementsBends: Support on both sides, maintain minimum cable bend radiusLong vertical runs: Include strain relief offsets to prevent tensionHanging rods: Minimum 8 mm diameter for stability Following these spacing guidelines ensures mechanical stability, cable protection, heat dissipation, and compliance with safety standards in cable tray installations.
