Change routing on core switch

Overview

Static routes are manually configured in the routing table. To enable routing and to add routes on a switch, complete the following steps: Set the filter to a group containing at least one switch. Other VFR's are routed on the Firewall. How would you configure the connection between Core and Firewall?

Currently we have a transit network (VLAN 100, 192. Currently, at each location, we have our ISP router connected to a little unmanaged switch, which then is. In this scenario, IP addresses of the interfaces connecting the core switch to the BRASs and firewalls and OSPF need to be configured on the core switch, so as to implement connectivity between the user network to egress network through the core switch. When configuring interfaces and routes, you. For enterprise network architects and senior infrastructure engineers, determining where Layer 3 routing logic should reside—on the core switch or the Next-Generation Firewall (NGFW)—is a foundational design decision. This can prevent devices on different VLANs from communicating with one another.
