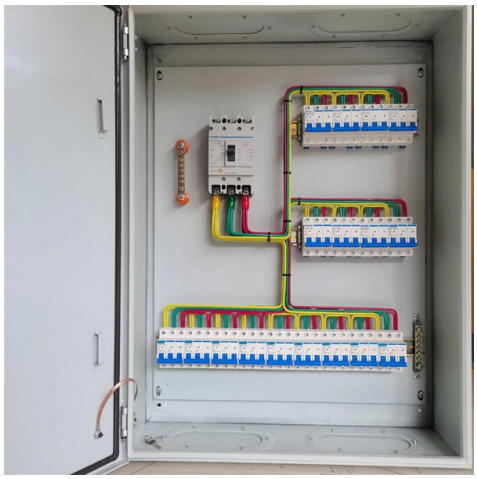
Configuration without neutral distribution box



Overview

The common "B" pipe in this arrangement is the "neutral". If you use only the “A pipes” it is called a “Delta” (triangle) connection. The primary reason a neutral wire is often missing in older switch boxes is due to a wiring configuration known as a switch loop. In this historical setup. The Three-phase networks without neutral also known as networks 3P3W or 3 wires are a type of electrical installation where only the three phases are available, without a neutral conductor. Although they often go unnoticed, these types of networks are still very common in numerous industrial and. Contractors did not include neutrals in houses constructed before 1985. Power generation The generator in a power station generates 3-phase electricity. the electrician ran all 200 Amps to the house and he sub feeded back to the detached garage with a 50 amp (2 wire) 240 V breaker. According to NEC Article 250, neutral and ground wires must remain separate in subpanels.
