Campus Network Authentication with Upgraded Optical Circulation Device

Overview

This project introduces an SDN-based authentication system for Campus Area Networks (CANs), utilizing a centralized control plane and a POX controller for efficient user authentication. This is to ensure that only authorized and qualified users can access the network. This section describes the. There is a tendency to discount the network as simple plumbing — to believe that the only design considerations are the size and the length of the pipes or the speeds and feeds of the links, and to dismiss the rest as unimportant. We will run fiber optic cabling from a central location in a hub-and-spoke fashion to each remote building Inside of each building. This infrastructure is composed of several essential services:Central NetConductor is an edge-to-cloud network and security framework designed to create dynamic and consistent security policy across a modern enterprise network of CX switches, AOS-10 Gateways, AOS-10 APs and EdgeConnect SD-WAN Gateways. Intelligent overlays built on highly available underlays.
