Fiber optic cable pierced

Overview

Infield installations, splicing is a faster and more efficient method and is used to restore fiber optic cables when a buried cable is accidentally severed. There are 2 methods of splicing, mechanical or fusion. Both methods provide much lower insertion loss compared to fiber. Fiber optics is the fastest and one of the safest ways to transmit information online. Fiber optic strands are ultra-lightweight and about as thin as human hair, and yet, they have more than eight times the pulling tension of a copper wire. Another method of connecting optical fibers is termination or connectorization, which consists of processing the end of a fiber optic bundle so that it can be connected to other fibers or devices through fiber optic. Fiber optic splicing is the process of seamlessly joining two single Splicing has a lower optical loss and back-reflection than other terminations, making it the ideal choice for maintaining signal integrity and reliability in fiber optic networks. Unlike connectors, which allow temporary links, a fiber optic cable splice fuses fibers for minimal signal loss—e. But what happens when you need to join two cables to extend a network or repair a break?

You can't just twist them together.
