Does multimode fiber support 40G

Overview

OM3 (multimode optical fiber with a core size of 50 micrometers) is commonly used in data center and enterprise environments to support high-speed networking applications, including 40 Gigabit Ethernet (40GbE). Multimode fiber enables the utilization of vertical-cavity, surface-emitting lasers (VCSELs) to provide synergistic, low-cost optical connectivity and electronic solutions. The core technologies of 40G Ethernet (40GbE) are quite mature, making the upgrade from 10G to 40G a straightforward and cost-effective. The compatibility of multimode fiber with 40G and 100G Ethernet technologies signifies a crucial advancement, enabling smoother transitions for organizations to adopt faster and more efficient systems. Transitioning to these technologies not only enhances data transmission rates but also improves. As 40G Ethernet remains a foundational speed for many enterprise and leaf-spine deployments, the Cisco QSFP-40G-SR4-S has emerged as a go-to optical solution. However, for those navigating procurement lists and technical datasheets, this specific SKU often raises more questions than it answers. As an advancement of OM3 fiber, OM4 fiber is chiefly used for 10G, 40G and 100G Ethernet.
