Grounding method for micro-module computer room

Overview

Multi-Point Grounding is essential for high-frequency circuits (>10MHz), such as digital processors and RF modules. Components are connected to the nearest low-impedance ground plane via short traces or vias. It will The indoor grounding system for a data center is critical to the operation of the facility. The traditional data center was. Modern Digital Communication have error correction methods and techniques built in like Parity bit, Check Sum and Cyclic Redundancy Check - To achieve clean signal in the receive end But sender may have to re-transmit data to help fully recover it. The unit subs feed panelboards which feed CPCs (which have 208-208Y/120V k-factor shielded isolation transformers and 4 wire panelboards). These are, Mesh Isolated Bonded Network or Mesh-IBN, Mesh Bonded Network or Mesh-BN or Star Isolated Bonded System or Star-IBN. In the diagram below the Mesh-IBN is depicted on the 2nd floor and the Star-IBN is depicted in the. Purpose The purpose of this Standard is to enable and encourage the planning, design, and installation of generic telecommunications bonding and grounding systems within premises with or without prior knowledge of the telecommunications systems that will subsequently be installed.
