# Fiber Optic Cable Connector Reserved Length Standard

## Overview

Standard for Installing and Testing Fiber OpticsUnless directed by the owner or other agency that unused cables are reserved for future use, remove abandon.

## Key Takeaways

The standard reserved length for fiber optic cable connectors is typically 10 inches from the back of the connector, with a tolerance of ±2 to ±3 inches depending on assembly requirements.

### Reserved Length Overview

In fiber optic cable assemblies, the reserved length refers to the portion of the cable near the connector that is left available for labeling, handling, or future re-termination. Labels or markers are generally placed within 10 inches from the back of the connector, ensuring they are easily visible and accessible for maintenance or identification purposes. For shorter assemblies, such as cables under 6 feet, a single label is usually sufficient, while longer cables may require multiple markers.

### Tolerances and Placement

Standard tolerance for label placement is ±2 inches, but it can be relaxed to ±3 inches if needed for manufacturability. Labels are typically 1–2 lines of text, with a maximum of 22–25 characters per line, and a default character height of 0. 1 inches.

For simplex cables, one line of marking is strongly recommended, while duplex or fan-out assemblies may use two lines. The reserved length ensures that the bend radius is maintained and that the connector is not stressed during installation or handling.

### Connector Considerations

Different connector types, such as LC, SC, ST, FC, and MPO/MTP, may influence the reserved length slightly due to ferrule size, coupling mechanism, and density requirements. For example: LC connectors use a 1. 25 mm ferrule and are common in high-density applications, requiring careful handling to avoid stress near the connector.

S

C connectors use a 2. 5 mm ferrule and are widely used in FTTH and enterprise networks, with similar reserved length practices. MPO/MTP connectors for multi-fiber applications may require additional slack to accommodate fan-out and alignment.

### Practical Recommendations

Always specify the reserved length when ordering pre-terminated assemblies to ensure proper labeling and handling. Maintain bend radius and slack near the connector to prevent signal loss or damage. Confirm labeling standards with the manufacturer, especially for military or industrial applications, as MIL-STD-130 may dictate specific marking requirements.

By following these guidelines, fiber optic assemblies can maintain performance, ease of maintenance, and compliance with industry standards.
