IP MAC binding to access switch

Overview

Use IP-MAC binding to prevent ARP spoofing. The port accepts a packet only if the source IP address and source MAC address in the packet match an entry in the IP-MAC binding table. You can enable or disable IP-MAC binding for the whole switch, and you can override this global setting. The device prevents user spoofing attacks by using an IP-MAC binding table to filter out illegitimate packets with forged source IP addresses or MAC addresses. Scheme 1 and scheme 2 realize the same function, that is, bind the MAC address (network card hardware address) of a specific host on a specific switch port, and scheme 3 binds the MAC address (network card hardware address) and IP address of a. MAC-binding means binding the media access control (MAC) address to a device's Internet Protocol (IP) address. Think about this as putting a nametag on every device that connects to a network.
