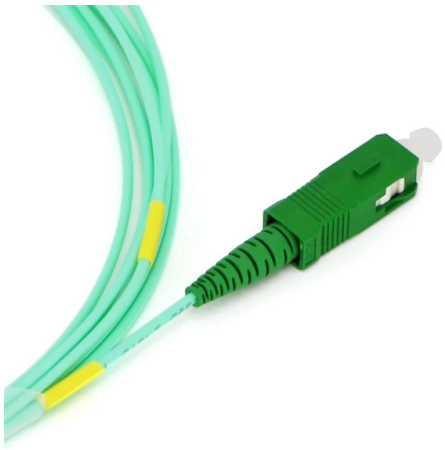
Network rack fan temperature



Overview

Maintaining 68°F–77°F (20°C–25°C) minimizes overheating risks while balancing cooling expenses. ASHRAE recommends this range for modern servers, though some operators push to 80°F (27°C) for energy savings. Maintaining the proper temperature within a server rack is crucial to ensure optimal performance and longevity of the equipment. Forced convection – adds fans to boost airflow in moderate setups. Techniques include air and liquid cooling, rear door heat exchangers. Implementing effective rack cooling ensures: Equipment Longevity: Protects sensitive components from thermal stress. Operational Reliability: Minimizes unexpected shutdowns. When the temperature is below the first threshold, the fan runs at minimum speed, and when it's above the second threshold, the fan runs at maximum speed. The fan speed increases linearly. According to the American Society of Heating, Refrigeration, and Air-Conditioning Engineers (ASHRAE), server rooms should be kept at 59 degrees F to 89. They should also have a relative humidity of 20 percent to 80 percent.
