Optical power transmitted via optical cable

Overview

Power-over-fiber (PoF) is a technology in which a fiber-optic cable carries optical power, which is used as an energy source rather than, or as well as, carrying data. This allows a device to be remotely powered, while providing electrical isolation between the device and the power. Optical power is a critical parameter in optical communications, referring to the amount of optical energy transmitted through a fiber optic cable. In this. We are researching trouble-free power transmission using light via free space or via optical fibres. Compared to conventional power transmission via copper cables, both fiber-optic transmission (known as power-over-fiber) and free-space wireless optical power transmission offer significant. Power-over-fiber is a power transmission technology using optical fibers that offers various features not available in conventional power lines, such as copper wires.
