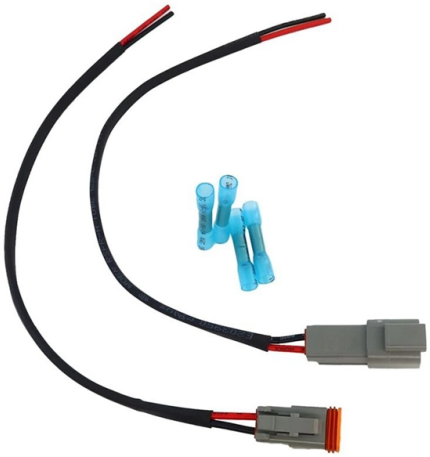
PoE switch default mode



Overview

auto: The auto mode is the default setting. PoE: Power over Ethernet (PoE) is a technology that allows Ethernet cables to carry electrical power, along with data, to powered devices. Provides details about the switch models supported by PoE. The initial allocation for Class 0, Class 3, and Class 4. The switch detects a Cisco prestandard or an IEEE-compliant powered device when the PoE-capable port is in the no-shutdown state, PoE is enabled (the default), and the connected device is not powered by an AC adaptor. It also features a variety of features, including port monitoring, system connection and management services, Virtual Local Area Network (VLAN) configuration. This 2025 guide explains how to enable, verify, and optimize PoE on Cisco switches, including standards, power budgeting, configuration commands, troubleshooting steps, and security recommendations.
