How to use the reset hole for the optical module

Overview

Replacing an Optical Module Before inserting an optical module, ensure that its latch is completely closed. Insert an optical module until you hear a click.

Key Takeaways

The reset hole on an optical module allows you to perform a factory or interface reset by pressing and holding it with a pointed object for a specified duration.

Steps to Use the Reset Hole

Locate the Reset Hole: Inspect the optical module or device for a small recessed hole labeled “Reset.” If it is not clearly marked, refer to the device manual for its exact location. Prepare a Pointed Object: Use a paperclip, pen tip, or similar small tool that can fit into the hole without damaging the device. Press and Hold: Insert the tool into the reset hole and press firmly.

Hold the button for 10–30 seconds depending on the device model. Some devices may indicate the reset process by flashing lights or a beep. Release and Wait: After holding the button for the required time, release it.

The optical module or device will reboot and restore factory or interface settings. Wait for the indicator lights to stabilize before using the device again.

Important Precautions

Do not unplug the fiber optic cable unless instructed by your ISP or device manual, as this can damage the optical path. Soft vs. Hard Reset: A soft reset (power cycle) may resolve minor issues without erasing configurations, while a hard reset (using the reset hole) restores factory settings and erases custom configurations.

Check Device Status: After resetting, verify that the physical layer or interface is in the “Up” state. If issues persist, further troubleshooting may involve replacing the optical module or checking the connected board. Using the reset hole correctly ensures safe restoration of the optical module without damaging the device or interrupting the fiber connection.
