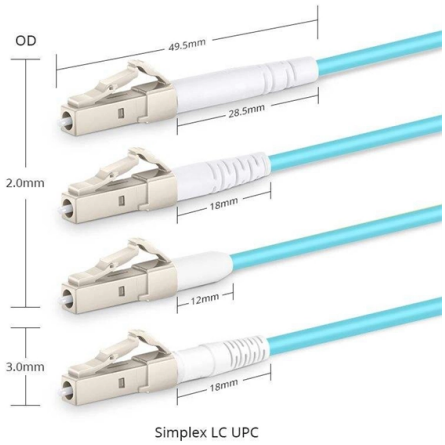
# How to wire a ground distribution box



Simplex LC UPC

## Overview

DISTRIBUTION BOX Attach a ground wire from one of the threaded studs (A) at the bottom of the housing, to the mounting plate (B). Attach a second grounding.

## Key Takeaways

Proper grounding of a distribution box involves connecting all metal parts and electrical components to a PE (protective earth) bus using appropriately sized copper wires, ensuring low resistance and secure connections. Key Steps for Grounding1. Identify the Grounding Points Open the distribution box and locate the grounding bar (PE bar) or the position marked with "PE" or a grounding symbol.

This is the central point where all ground wires will connect. 2. Connect the Power Ground Wire Use a copper core wire to connect the incoming power ground to the PE bar.

Strip the wire to the required length, insert it into the terminal, and tighten the screw to ensure a firm connection. The wire should be yellow-green insulated and meet the minimum cross-sectional area specified for your region (e.g., 10 AWG in the US or 6 $mm^2$ elsewhere),. 3.

### Ground the Metal Box and Components

For metal distribution boxes, attach a ground wire from the box grounding bolt to the PE bus using a copper wire or braided soft wire. Connect all internal electrical components that require grounding to the PE bus to ensure safe operation. If the box is connected to metal conduits, ensure they are electrically bonded to the box, either by welding or using conductive fittings.

4. Connect to the Central Grounding System Attach a wire from the PE bus or mounting plate to the factory or building central grounding point. The total ground resistance between all system parts should be less than 0.

1 Ohm for high-reliability applications. 5. Special Considerations for Plastic Boxes If the distribution box is plastic, connect a ground wire from any metal components inside the box to a ground rod buried in the earth.

Ensure the contact area is sufficient and test the ground resistance with a voltmeter to meet safety standards. 6. Testing and Verification After installation, measure the grounding resistance to confirm it meets the required safety standards.

Ensure all connections are tight, clearly marked, and free from corrosion or looseness.

### Wire Sizing and Alternatives

### For U

S applications: 10 AWG for general grounding, 6 AWG for connections between mounting plate and spindle plate in industrial setups. For other regions: 6 $mm^2$ copper wire is standard. In some cases, an extra ground wire between mounting plate and spindle plate may be optional depending on cable length and number of spindles, but including it ensures proper grounding in all scenarios.

### Summary

Effective grounding of a distribution box requires: Connecting the PE bus to the power ground and central grounding pointBonding the metal box and all components to the PE busUsing appropriately sized copper wires with yellow-green insulationTesting resistance to ensure it is below safety thresholds Following these steps ensures electrical safety, reduces the risk of faults, and complies with standard grounding practices.
