Infrared laser diode combustion

Overview

Direct absorption (DA) and wavelength-modulation-spectroscopy (WMS) strategies are investigated for extended near-infrared and mid-infrared laser devices to detect target species in harsh environments at combustion exhaust temperatures in the presence of high moisture level. Direct absorption (DA) and wavelength-modulation-spectroscopy (WMS) strategies are investigated for extended near-infrared and mid-infrared laser devices to detect target species in harsh environments at combustion exhaust temperatures in the presence of high moisture level. A diode laser was employed to scan single absorption lines of CO in a laminar premixed propane-air flat flame at atmospheric pressure, to determine from the fully resolved absorption line data the fundamental quantities of line strength and collisional linewidth under combustion conditions, and to. Of all the laser-diagnostic techniques, LAS is arguably the most versatile and quantitative, as it has been used extensively to provide quantitative, species-specific measurements of gas temperature, pressure, composition and velocity in both laboratory- and industrial-scale systems. Historically. Laser-absorption spectroscopy (LAS) is an established technique providing noninvasive measurements of temperature, pressure, and species concentrations in combustion environments. Multiplexed, fiber-coupled, near-infrared distributed feedback lasers were used to probe three water vapor absorption features in the 1.

Article Content

(PDF) Tunable Diode Laser Absorption Based Sensors

Sensors based on infrared laser absorption spectroscopy (IR-LAS) can be employed in the diagnosis and characterization of a wide range of

Tunable Diode Laser Sensors for Combustion

High sensitivity monitoring of combustion species using compact semiconductor lasers began shortly after their invention in the mid 1970s, and included portable sensors for monitoring CO emissions

High-resolution spectroscopy of combustion gases using a tunable ir ...

An experimental arrangement and some empirical results are described for high-resolution absorption spectra of CO in the post-flame region of a flat-flame burner, using a tunable IR diode laser.

Infrared laser-absorption sensing for combustion gases

Historically, most IR-LAS work has been conducted using tunable diode lasers, however, today''s researchers have access to wide range of light sources that provide unique sensing capabilities and

Measurement of temperature, velocity and water vapor concentration

Measurement of temperature, velocity and water vapor concentration in a scramjet combustor based on near-infrared diode laser absorption Fei Li, XiLong Yu

Development of laser absorption sensors for combustion gases

The field demonstration of the infrared laser absorption sensors showed great potential for real-time combustion exhaust monitoring and control of practical combustion systems.

A 120 kHz mid-infrared TDLAS sensor for combustion efficiency ...

This study presents a 120 kHz state-of-art mid-infrared tunable diode laser absorption spectroscopy (TDLAS) sensor to measure H 2 O concentration, temperature, axial velocity, and

Near-infrared diode laser absorption diagnostic for temperature and ...

Tunable diode laser absorption measurements of gas temperature and water concentration were made at the exit of a model scramjet combustor fueled on JP-7.

How to Use a Diode Laser in a Combustion Chamber

© 2026 KENHARDT OPTICAL NETWORKS - All rights reserved

A smart illumination diode laser can be used to develop steady combustion conditions in a combustion chamber.

In-situ CO measurement of gas and oil combustion flame using near ...

Tunable diode laser absorption spectroscopy based on molecular absorption provides a non-intrusive, sensitive and fast method for gas detection in combustion environments. As an

Tunable diode laser absorption spectroscopy for open-path monitoring ...

A near-infrared (NIR) distributed feedback (DFB) diode laser emitting near 1579 nm was used as an excitation light source for simultaneously measuring dual-gas fingerprint absorption

Tunable diode laser spectroscopy as a technique for combustion ...

Tunable diode laser absorption spectroscopy (TDLAS) has become a proven method of rapid gas diagnostics. In the present review an overview of the stat

Development of laser absorption sensors for combustion gases

Continuous, unattended monitoring with fast time response and large dynamic range was demonstrated. The field demonstration of the infrared laser absorption sensors showed great potential for real-time

Infrared laser absorption sensors for multiple performance parameters ...

Laser absorption sensors have matured into robust and practical tools for providing non-intrusive, in situ measurements of temperature, composition, and velocity in harsh environments ,

An improved study of the uniformity of laminar premixed flames using ...

A tunable continuous-wave diode laser at 1343 nm (Qingchen), a mid-infrared DFB at 2482 nm (NanoPlus), and a mid-infrared ICL at 4183 nm (NanoPlus) were employed as the light sources.

Diode infrared laser

Diode infrared laser has become a staple for clients in aesthetic medicine looking for transformational solutions for beauty enhancement and rejuvenation. Through modern laser technology, this

Integrated-path multi-gas sensor using near-infrared diode lasers: An ...

Tunable diode laser absorption spectroscopy (TDLAS) in the near-infrared (near-IR) region has become a preferred method for selective and precise gas identification and quantification,

© 2026 KENHARDT OPTICAL NETWORKS - All rights reserved

DIODE LASER-BASED MEASUREMENTS OF FUELS, AND COMBUSTION

ABSTRACT Near infrared tunable diode laser spectroscopy is used to quantify HF gas produced during fire suppressant testing of halon alternatives. Results of comparisons with other techniques for
