Installation Regulations for Metering Distribution Boxes

Overview

ELECTRIC SERVICE REQUIREMENTS REVISION PAGE The added service equipment must be located and installed in conformance with applicable codes, laws, and ordin.

Key Takeaways

Metering distribution boxes must be installed in compliance with utility, safety, and local electrical standards, ensuring proper enclosure, sealing, spacing, accessibility, and protection for both metered and unmetered conductors.

General Requirements

Metering distribution boxes serve to safely distribute electricity and house metering equipment. Proper installation is critical to prevent hazards such as short circuits, fire, or system failure, and to ensure compliance with standards like NEC, IEC, or local utility regulations. Key general requirements include: Enclosure Type and Rating: Use enclosures with appropriate IP or NEMA ratings to protect against dust, water, and mechanical damage.

Outdoor installations typically require IP65 or IP66-rated GRP enclosures. Materials can be steel for durability or plastic for indoor use. Accessibility: Install boxes in dry, ventilated, and easily accessible locations, typically at a height of ~1.

5 meters for residential or commercial premises. Separation of Conductors: Line-side (unmetered) and load-side (metered) conductors must not share the same raceway or enclosure, except in specific meter socket or current transformer enclosures. Sealing: All cabinets, conduit fittings, and enclosures containing unmetered conductors must be sealable.

Seals must be applied using stud and wing-nut assemblies or sealing screws, with minimum dimensions specified (stud 1/4” x 20, drilled 0. 0635”) to prevent tampering. Protection Devices: Include circuit breakers, fuses, surge protectors, and ensure each circuit has its own protection.

Metering-

Specific Requirements

Utility Ownership: Only equipment belonging to the utility or meter operator should be installed within the meter enclosure. Space Allocation: Follow guidelines such as ENA EREC G87 for minimum space requirements, ensuring sufficient room for current and future metering equipment, including smart meters and three-phase intakes. Labeling: All meters and associated equipment must be clearly labeled with unit or apartment numbers, and permanent labels should be used for multi-meter installations.

Inspection and Approval: Metering installations must comply with local inspection authorities and utility service requirements. Contractors must be present during inspection, installation, and activation, and provide approved single-line diagrams and meter schedules.

Smart Meter Considerations

Outdoor Mounting: For villas or restricted buildings, meters should be mounted outside on boundary walls for easy access. Enclosure Ratings: Smart meter enclosures must meet IP66/IP65 standards to ensure durability and protection against environmental factors. Connection Points: Must be accessible for maintenance, corrective, and preventive operations by the utility.

Maintenance and Compliance

Regular Inspections: Schedule periodic inspections to ensure seals are intact, wiring is secure, and protection devices function correctly. Documentation: Maintain records of installation, inspection, and any modifications for future reference and compliance verification. By adhering to these regulations, metering distribution boxes will provide safe, reliable, and compliant service while accommodating future upgrades and smart metering technologies.
