Three-stage line relay protection

Overview

Three-stage over-current protection is the most typical over-current protection of power lines. It includes transient rapid-break over-current protection (stage I protection), time-bound rapid-break over-current protection (stage II protection), and definite time. Three-Step Current Protection is a classic protection relay scheme widely implemented in power systems for safeguarding transmission lines and electrical equipment. Applications of the concepts to accepted transmission line-protection schemes are also presented. Many important issues, such as coordination of settings, operating times, characteristics of. SEL relays detect faults and other abnormal conditions in electric power systems and initiate protective actions to maintain system stability and safety. The presented scheme does not use weak-infeed logic and transfer tripping predicated on one terminal being strong.
