Key Takeaways

The Mali DC Distribution Box (Gilbarco PA0261/MDE-2713) requires careful configuration of current loop settings, jumper positions, and protection parameters to ensure safe and reliable operation.

Interface and Current Loop Settings

The distribution box interfaces between Gilbarco consoles with Two-Wire Current Loop (TWI) or RS-422 interfaces and dispensing units, CRINDs, or G-CAT controllers. Each distribution board must be dedicated to a specific type of equipment; mixing different current loop devices on one board is not allowed. Current Loop Configuration: For Gilbarco dispensers and CRINDs: 45 mA unregulated 12 V DC supplyFor G-CAT controllers: 20 mA unregulated 12 V DC supplyJumper Settings: Jumpers on the distribution board must be set according to the connected device type to prevent damage to MPU boards.

Wiring and Installation Guidelines

Maximum wiring length between the distribution box and dispensers: 2600 feet using 14 AWG stranded or solid wireNo daisy chaining of dispensers is allowedOnly one dispenser or card reader per data loop channelUse the Pigtail Cable Kit (K93391-01) for Transac System 1000 or PAM 1000 installations Protection and Fault SettingsDC distribution systems require careful protection due to limited short-circuit current and fast fault transients. Typical faults include: Bipolar short-circuit fault: requires rapid isolation within millisecondsPole-to-ground fault: less harmful due to high-impedance groundingBroken conductor fault: minimal fault current but must be monitored Protection settings should include: Overcurrent and undervoltage thresholdsDifferential protection criteria for single-ended or double-ended protectionBoundary characteristics of current-limiting reactors to detect high-frequency fault componentsEnvironmental and Safety ConsiderationsOperating temperature: 0°C to 55°C (32°F to 130°F)Humidity: 5–95% non-condensingEnsure compliance with NFPA 30A, NFPA 70, and local electrical codesAlways perform total electrical shut-off before servicing dispensers; emergency stop buttons at the console do not cut power to pumps SummaryTo correctly set up a Mali DC Distribution Box: Configure jumpers according to device type (Gilbarco, CRIND, G-CAT)Ensure proper current loop settings (45 mA or 20 mA)Connect only one device per channel and maintain wiring limitsImplement overcurrent, undervoltage, and differential protection schemesFollow all safety codes and perform total electrical shut-off before maintenance These steps ensure safe, reliable, and compliant operation of the DC distribution system.
