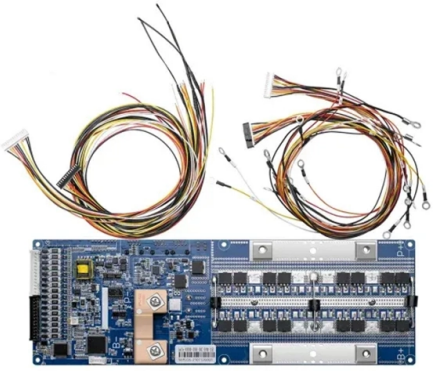
# What does the aggregation switch connect to



## Overview

The aggregation switch connects to multiple access switches and consolidates their traffic. It is essential for larger networks requiring efficient data flow. In a traditional three-tier network design, it's the policy hub: the place where traffic gets organized, filtered, and routed between different. It is a networking tool called an aggregation switch that enables the consolidation of several network connections into a single link. To aggregate numerous links into a single, logical connection, aggregation switches. An Aggregation or "Top-of-Rack" switch is designed to connect everything in a rack at high speeds, then have an even bigger pipe out to the rest of the network. It does this by splitting traffic across multiple ports instead of forcing clients to use a single uplink port on a switch.
