What materials are needed for a beam splitter

Overview

In its most common form, a cube, a beam splitter is made from two triangular glass prisms which are glued together at their base using polyester, epoxy, or urethane-based adhesives. (Before these synthetic resins, natural ones were used, e. the amount of light in the reflected arm versus the amount of light in the transmitted arm, while polarizing beamsplitters are specified by their extinction ratio, i. Circular beamsplitters, plate beamsplitters and cube beamsplitters can be purchased for polarizing or non polarizing beamsplitting. A beam splitter (or beamsplitter, power splitter) is an optical device which can split an incident light beam (e.
