What temperature is appropriate for a secondary distribution box

Overview

Target Temperature: Keep internal temperatures below 95°F (35°C) to ensure safe and efficient operation. Passive: Vents, shade, and natural airflow – best for mild conditions. The information provided in this document contains general descriptions, technical characteristics and/or recommendations related to products/solutions. This document is not intended as a substitute for a detailed study or operational and site-specific development or schematic plan. If it gets too hot, parts can stop working or even catch fire. You'll learn. Liquid-filled transformers are suitable for use up to 65 °C average winding rise (75 °C average winding rise with Envirotemp FR3 fluid) over a maxi mum ambient temperature of 40 °C, not to exceed 30 °C average for any 24-hour period. The secondary bus is perpetually powered by all network. What is a distribution box?
