Function of cable tray elbow joint

Overview

Cable tray elbow fittings come in various angles and configurations—most commonly 45° and 90° bends—to accommodate complex routing requirements. Horizontal elbows enable smooth transitions across flat surfaces, while vertical elbows allow cables to move upward or downward without. maintain spacing or to keep cables in place when the tray is ect the minimum bend ra-dius for cables as they exit the bottom of the cable tray. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when the cable tray cont d for instrumentation and control applications that require. Cable tray fittings are essential components used to connect, support, and transition cable trays through different directions, levels, and termination points. Whether your system uses ladder cable trays, perforated trays, wire mesh trays, FRP, aluminum, stainless steel, or galvanized steel, these. This publication is intended as a practical guide for the proper and safe* installation of cable ladder systems, cable tray systems, channel support systems and associated supports. Far superior to traditional conduit in many applications, cable tray systems offer unparalleled accessibility for maintenance. with the same or different width of the cable run. All fittings are available in sizes and types corresponding to the straight cable tray sections.
