PoE switches do not exchange data

Overview

A PoE switch represents an advanced step in network development, combining data transmission and power supply through a single cable. Unlike routers, switches focus on data exchange within the LAN, utilizing a MAC address table to accurately send. Power over Ethernet is a technology that transmits both electrical power and network data over an ethernet cable. With PoE, each Ethernet interface of switches can supply power to devices like Voice over Internet Protocol (VoIP) phones,Internet Protocol Camera (IP camera) or security cameras, and. A PoE switch delivers both power and data to IP cameras over a single Ethernet cable, eliminating the need for separate power adapters and simplifying installation. Inside each ethernet cable are sets of twisted pairs of wires.
