Relay protection current injection

Overview

Secondary Injection Testing bypasses the high-current path by injecting signals into the relay's secondary circuits. This method checks protective relay logic, trip mechanisms, and communication without stressing the full current path. Unlike primary injection testing, which. The Kingsine KF86P universal relay test kit marks a multipurpose, light-weight, field portable secondary injection test kit. It is capable of testing a wide variety of electro-mechanical, solid state, and microprocessor based protective relays, motor overload relays, IEC61850 testing, and similar. The purpose of the rotor earth-fault protection is to detect earth faults in the excitation circuit of synchronous machines. The excitation field circuit is isolated during normal operating conditions. The purpose of secondary injection testing is to prove the correct operation of the protection scheme that is downstream from the inputs to the protection relay (s). The system consists of a control unit and a current unit.
