Single-mode fiber wavelength classification

Overview

The IEC and ITU-T and under zero-dispersion wavelength and the resulting displacement of the cut-off wavelength single-mode fiber is divided into six types.

Key Takeaways

Single-mode fibers are classified by their operating wavelength ranges and zero-dispersion characteristics, with ITU-T standards G. 652 to G. 656 defining the main types for 1310 nm and 1550 nm applications.

Overview of Single-

Mode Fiber WavelengthsSingle-mode fibers are designed to support only the fundamental mode (LP01) for a given wavelength, typically in the 1310 nm and 1550 nm regions. The cut-off wavelength defines the lower limit below which higher-order modes may propagate, while the zero-dispersion wavelength indicates where chromatic dispersion is minimal, optimizing long-distance transmission ( ). 1310 nm band: Often used for short- to medium-distance transmission; low dispersion and moderate attenuation.

1550 nm band: Preferred for long-haul and submarine cables due to minimal attenuation and compatibility with erbium-doped fiber amplifiers (EDFAs) ( ). ITU-T Standard Fiber TypesSingle-mode fibers are categorized by ITU-T based on their wavelength and dispersion properties: G. 652 (Standard Single-Mode Fiber): Optimized for 1310 nm with low attenuation at 1550 nm; zero-dispersion wavelength around 1310 nm.

Variants G. 652A/B/C/D extend the usable wavelength range and reduce water-peak attenuation for CWDM applications ( ). G.

653 (Dispersion-Shifted Fiber): Zero-dispersion wavelength shifted to 1550 nm to minimize chromatic dispersion in the C-band; suitable for single-channel long-distance transmission but may suffer nonlinear effects in WDM systems ( ). G. 654 (Large Effective Area Fiber): Designed for ultra-long-haul submarine systems; low attenuation in the 1550 nm region with a large mode area to reduce nonlinear effects ( ).

G. 655 (Non-Zero Dispersion-Shifted Fiber): Zero-dispersion wavelength slightly offset from 1550 nm to balance dispersion and nonlinear effects in dense WDM systems ( ). G.

656 (Wideband Non-Zero Dispersion Fiber): Supports a broader wavelength range (1360–1625 nm) for CWDM and DWDM applications, maintaining controlled dispersion across the band ( ). Practical ConsiderationsCut-off wavelength: Ensures single-mode operation; typically around 1260 nm for standard fibers like SMF-28 ( ). Attenuation: Minimum around 0.

18 dB/km at 1550 nm for long-distance fibers ( ). Dispersion management: Critical for high-speed (10 Gbit/s and above) and WDM systems; fiber type selection depends on the transmission distance, wavelength band, and system design ( ). SummarySingle-mode fibers are classified primarily by operating wavelength, zero-dispersion wavelength, and ITU-T standard type.

The 1310 nm band is used for short- to medium-range links, while the 1550 nm band is preferred for long-haul and submarine applications. ITU-T standards G. 652 to G.

656 provide a framework for selecting fibers based on dispersion, attenuation, and wavelength range, ensuring optimal performance for different optical communication systems ( ).

ITU G.654: Covers single-mode fibre which has the zero-dispersion wavelength around 1300 m wavelength which is cut-off shifted and loss minimized at a wavelength around 1550 nm and which is

Recommendation ITU-T G.652 (08/2024)

Characteristics of a single-mode optical fibre and cable Summary Recommendation ITU-T G.652 describes the geometrical, mechanical and transmission attributes of a single-mode optical

Single-Mode Fiber Cable Guide: Types, Specs & Selection

According to TIA-492CAAA, single-mode fiber must exhibit a cutoff wavelength below 1260nm to qualify as SMF. This standard ensures single-mode operation across the

Cut-off Wavelength – modes, waveguide, single-mode fiber

The single-mode regime is defined by the cut-off wavelength of the second-lowest order mode (LP 11 in standard fibers). The fiber guides only a single mode for all

Fiber Optic Cable Types Explained

Learn all about the differences between single mode and multimode cables, as well as the various fiber wavelengths and standard core sizes used in fiber optics.

SFP Wavelength Guide: 850nm vs. 1310nm vs. 1550nm

Determine whether the link uses multimode fiber (MMF) or single-mode fiber (SMF). 850 nm is typically used for MMF, while 1310 nm and 1550 nm are designed for SMF.

Overview of Single-mode Fiber Types | by Orenda

However, when it comes to single-mode, it may not be as simple as you think. The classification of single-mode fiber is much more complicated than

Understanding Wavelengths In Fiber Optics

Understanding Wavelengths In Fiber Optics Fiber optics is full of jargon but it''s important to understand it. One of the more confusing terms to many is "wavelength." It sounds very scientific, but it is simply

Single Mode Fiber: Types and Applications

Single mode fiber (SMF) is a type of fiber optic cable that only allows one light mode to transmit at a time. Generally, single mode cable has a narrow core diameter of 8 to 10µm

SINGLE MODE FIBER TYPES AND APPLICATION

© 2026 KENHARDT OPTICAL NETWORKS - All rights reserved

Now replaced by G655 G654: a cut-off shifted single-mode optical fiber The common core is pure SiO2, while the ordinary ones need to be doped with germanium. The G. 654 fiber is a single mode optical

Optical Fiber Types: Single-Mode vs. Multimode

Optical fiber is the backbone of modern networks — from the internet backbone that connects cities to the short links inside data centers. Optical Fiber comes in two main categories:

Single Mode vs. Multimode Fiber Optic Cables

There are two main types of fiber optic cables: single mode and multimode. Although they can do the same job in some instances, the different

Singlemode vs Multimode Fiber Optic Cable

We breakdown the differences between single mode and multimode fiber optic cable, covering aspects like physical structure, bandwidth over

5 Types of Single-Mode Fiber: Understanding Your

Learn about the different types of single-mode fiber for optimized network performance. Find out which fiber type suits your specific connectivity

Multi-mode optical fiber

Applications The equipment used for communications over multi-mode optical fiber is less expensive than that for single-mode optical fiber. Because of its high capacity and reliability, multi-mode

Fiber Optic Cable Types – Multimode and Single Mode

And since each wavelength takes a different path down the core of the fiber, some fiber types are better suited for some wavelengths. As you will
