Standards for installing distribution box baffles

Overview

There are well established industry rules and guidelines (such as API guides, Shell DEP's and NORSOK Standards) for the design of new separators and inlet/outlet devices when it comes to feed inlet and gas/liquid outlet velocity and momentum. They provide a broad consensus on the maximum allowable. 1) Thread each Box Baffle onto the square crossrunners as per the design specified by client. Refer to specification for correct arrangement and spacing of sleepers for your job. a calming baffles are perforated baffles typically installed downstream of the inlet device in horizontal 3 phase (gas/liquid/liquid) or 2 phase (liquid/liquid) separators covering the entire liquid section. The drawing should be approved by the project design and management authority before use to ensure that it meets with their. Hardware will vary depending on install method - Hardware sold separately. C) Fit braces using clips, align clips with the notches in box baffle. Remove the squares from the Box. A Very effective method to reduce flow turbulence is by installing a liquid distribution baffle.

Anti-wave baffles should be considered where the gas velocity (K-factor) exceeds 0.1 m/s (0.3 ft/s) and the free, unbaffled liquid surface length exceeds 6m (20 ft). This will mitigate the risk from wave
