Switch power-on optical module

Overview

Data Center Power Solutions for Optical Systems and ModulesAnalog Devices' optical power solutions, including thermoelectric cooler (TEC) controllers, load.

Key Takeaways

Optical modules in switches are powered through the switch interface, and their operational status can be monitored via diagnostic commands or integrated co-packaged optics solutions.

Powering Optical Modules

Traditional pluggable optical modules, such as SFP, SFP+, or QSFP types, receive power directly from the switch interface when the switch port is enabled. The switch provides the necessary voltage and current to the module, allowing it to initialize its laser or photodiode components for optical signal transmission and reception. Proper power-on ensures the module can establish a link and maintain stable optical output without overloading the switch power supply.

Monitoring and Diagnostics

Once powered, the module's status can be monitored using switch commands. For example, on Cisco switches, the show interface command displays link status, module type, optical power, and temperature, helping detect faults or compatibility issues. Huawei switches provide similar functionality with commands like display transceiver and display transceiver diagnosis, which show digital diagnostic monitoring (DMM) data including transmit/receive power, voltage, and temperature.

Monitoring these parameters ensures the module operates within safe limits and prevents damage to the switch interface.

Compatibility Considerations

Using certified optical modules is critical. Non-certified modules may have nonstandard sizes, defective data buses, or incompatible edge connectors, which can prevent installation, damage the switch interface, or cause abnormal operation. Always verify that the optical module is compatible with the switch vendor to ensure reliable power-on and operation.

Co-

Packaged Optics (CPO)CPO integrates the optical module directly with the switch ASIC, reducing the electrical path length and improving power efficiency. Unlike traditional pluggable modules, CPO modules are powered and controlled as part of the ASIC package, minimizing power loss and improving signal integrity. This approach is particularly beneficial for high-speed data centers using 400G, 800G, or 1.

6T Ethernet, as it reduces power consumption and failure points compared to traditional pluggable optics.

Best Practices

Always use vendor-certified optical modules to avoid interface damage and operational issues. Monitor optical power, temperature, and voltage during power-on to ensure safe operation. For high-speed or large-scale deployments, consider CPO solutions to reduce power loss and improve link reliability.

Ensure switch firmware supports the module type and provides diagnostic commands for real-time monitoring. By following these practices, optical modules can be safely powered on, monitored, and maintained for reliable network operation.
