The earliest relay protection

Overview

The concept of relay protection did not exist until the early 1900s. In 1901, the induction-type overcurrent relay was introduced, followed by ASEA (now ABB) launching the first time-delay overcurrent relay, TCB, in 1905, enabling graded protection. The rectangular devices are test connection blocks, used for testing and isolation of instrument transformer circuits. These relays operated based on mechanical movement, with components like coils, springs, and armatures working together to detect abnormalities in the electrical system. Information about their widespread use comes to us from the 70s of the XIX century. It was he who, in the 90s of the XIX century, developed. ilestone in relaying, the overcurrent protective relay was the workhorse of the in nd new technology of the 1970's (as power systems matured) caused a significant change.

In electrical engineering, a protective relay is a relay device designed to trip a circuit breaker when a fault is detected. The first protective relays were electromagnetic devices, relying on coils operating on moving parts to provide detection of abnormal operating conditions such as over-current, overvoltage, reverse power flow, over-frequency, and under-frequency.
