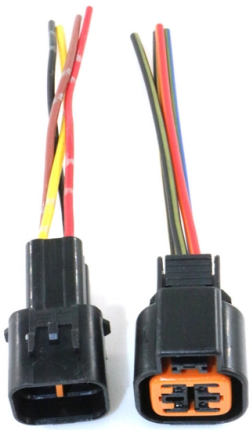
What bandwidth options are available for optical modules in a switch



Overview

QSFP starts at 40 Gbps, with QSFP28 and QSFP-DD modules supporting 100–400 Gbps, making them ideal for bandwidth-heavy environments such as cloud data centres, video streaming backbones, and large enterprise cores. SFP (Small Form-factor Pluggable) modules are hot-swappable transceivers used in networking equipment to transmit and receive optical signals. They're inexpensive, easy to terminate, and play nicely with legacy switches and appliances. Short-reach multimode 1000BASE-SX parts are commonly used inside buildings — you'll see quoted reaches like a few hundred meters on. In this guide, we break down the differences between these modules and help you make the best decision for your infrastructure—whether you're upgrading a legacy system, increasing the bandwidth of a modern network or building a future-ready data center. What are Optical Modules?

An optical module (or optical transceiver) is a pluggable device inserted. Optical transceivers are small, hot-pluggable modules that convert electrical signals into optical signals—and vice versa—enabling fibre optic communication between network devices with remarkable efficiency and reliability.
