Loop Detection on Access Switches

Overview

Cycle & Core Purpose: Loopback Detection (LBD) follows a fixed 4-step cycle with a configurable 1–10 second interval, ensuring real-time monitoring of unintended network loops. Generate & Send LBD Packets: The device sends LBD packets from ports where LBD is enabled (e. These issues can arise when a port is connected to a switch that is in a loop state. A loop state typically results from human error—specifically, when two ports on the. You can configure the loop detection in two ways, loose mode and strict mode. In Loose Mode, loop detection is. Our existing design is quite simple, it consists of several switches acting as layer 2 (around 6-7) and all of them are connected to a switch through single interface trunk ports. This switch is connected to a firewall which is the gateway for all VLANS defined, which are extended in all the. Network loops occur when there are multiple paths between two devices in a network, resulting in an infinite loop of data transmission, which in turn leads to broadcast storms, MAC table instability, and a significant degradation in overall network performance, even a complete crash. We also welcome pretty much anything else related to small networks.

Article Content

How to Use Loop Detection to Protect Your Network

Luckily, the managed switches used in the plant network have Loop Detection enabled. Upon detecting that its own probe packets are being reflected back through a different port, the

Solved: RUCKUS Forums

In Loose Mode, loop detection is configured on the VLAN basis. Loose Mode disables the port if packets originate from any port or VLAN on the same device. So please configure the loop

Solved: Access layer

Looking for some advice on what would be the best approach to prevent physical loops at the access layer. Our existing design is quite simple, it consists of several switches acting as layer 2

Best practice to prevent network loops with Omada

This paper describes the recommended configuration on Omada SDN solution to prevent network loops and broadcast storms.

My ethernet switch has a "loop prevention" feature. Why would

The loop prevention feature of most switches is "Rapid Spanning Tree Protocol" or RSTP. If it''s a managed switch, you can set ports that aren''t connected to other switches as edge ports which

What is Loopback Detection in Switches and How It Works

Learn what loopback detection is, how it works in switches, and how it differs from Spanning Tree Protocol. Discover industrial solutions to prevent

Loop and MAC Flap Detection on MS

This article describes how loop detection and MAC flap feature work and how this can be used for monitoring and troubleshooting purposes.

Loop Protection

The loop protect feature detects and avoids the formation of loops on the Ethernet ports of a Campus AP, Remote AP, or Mesh AP. The loop protect feature can be enabled on all APs that have multiple

How to Use Loop Detection to Protect Your Network

© 2026 KENHARDT OPTICAL NETWORKS - All rights reserved

In this video, you''ll learn how Loop Detection safeguards your network against accidental loops and broadcast storms.

Configuring Loop Detection Guard

Restrictions for Loop Detection Guard Loop detection guard can be configured only on Layer 2 physical interfaces. Layer 3 ports and virtual interfaces, such as port channels, switch virtual interfaces (SVIs),

Layer 2 Configuration Guide, Cisco IOS XE Bengaluru 17.6.x (Catalyst ...

Configuring Loop Detection Guard Layer 2 Configuration Guide, Cisco IOS XE Bengaluru 17.6.x (Catalyst 9300 Switches)

Enable Loopback Detection on a Switch through CLI

When a loop is discovered, the port that has received the LBD packet is placed in a shutdown state. LBD can detect the following loops: Shorted wire –

How to detect loops created by unmanaged switches?

Is there a way to detect unmanaged switches that are connected on access ports? In a spanning tree trunking managed network I look at bpdu errors on ports which usually indicate an

Layer 2 Configuration Guide, Cisco IOS XE Amsterdam

Configuring Loop Detection Guard Layer 2 Configuration Guide, Cisco IOS XE Amsterdam 17.2.x (Catalyst 9300 Switches)

What Is Loop Detection On A Network Switch?

What Is Loop Detection On A Network Switch? Loop detection on a network switch is an essential feature that plays a critical role in maintaining network efficiency. In this informative video, we ...

Configuring Loop Detection Guard

While Spanning Tree Protocol (STP) is normally the protocol that is configured for this purpose (to prevent network loops), loop detection guard is suited to situations where there may be unmanaged

Loop detection again and again on different switches

Several loop detections and port blockings are detected several times a week, then everything is not available again for a short time because it is

Solved: Method for detecting loops.....

© 2026 KENHARDT OPTICAL NETWORKS - All rights reserved

Commonly these loops come from classrooms that have mini-sw''s that are looped onto themselves or a wall jack connected to mini sw and that mini sw then connected to another wall drop
