Which wavelength to use for testing optical cables

Overview

Compare loss, transmission distance, and real-world applications to choose the right wavelength for your network or custom cable solution.

Key Takeaways

Standard wavelengths for fiber optic testing are 850 nm, 1300/1310 nm, and 1550 nm for glass fibers, and 650 or 850 nm for plastic optical fiber (POF).

Standard Testing Wavelengths

Multimode Glass Fiber: Typically tested at 850 nm and 1300 nm. These wavelengths correspond to low-loss windows in the fiber and match the operating wavelengths of LEDs or laser sources used in multimode systems.

Single-

Mode Glass Fiber: Usually tested at 1310 nm and 1550 nm. These wavelengths minimize attenuation and scattering, providing accurate measurements of insertion loss and identifying potential stress points in the fiber. Plastic Optical Fiber (POF): Commonly tested at 650 nm (red light) or 850 nm, as these wavelengths have lower absorption in plastic materials.

Why These Wavelengths Are Used

Attenuation Minimization: Infrared wavelengths (850, 1300, 1550 nm) experience lower scattering and absorption in glass fibers, allowing for longer transmission distances with minimal loss. Avoiding Water Absorption Peaks: Certain wavelengths, like 1383 nm, coincide with water absorption bands in glass, which can increase loss. Standard testing wavelengths avoid these peaks.

Equipment Calibration: Power meters and OTDRs are calibrated at these standard wavelengths to ensure accurate measurement of optical power and loss.

Practical Testing Considerations

Matching Source and Meter: Always set the power meter to the same wavelength as the test source to obtain accurate readings.

OTD

R Testing: For long outside plant cables with splices, OTDR measurements at the standard wavelengths verify individual splice quality and overall link performance.

C-

Band and CWDM Systems: For specialized systems, testing may include 1550 nm, 1625 nm, or 1650 nm to comply with system specifications and avoid water absorption peaks.

Summary

For reliable optical cable testing, use 850 nm and 1300 nm for multimode fibers, 1310 nm and 1550 nm for single-mode fibers, and 650 nm or 850 nm for POF. These wavelengths are chosen to minimize loss, match system operating conditions, and ensure accurate calibration of test equipment, providing consistent and standardized measurements across fiber optic networks.

The test source should match the type fiber (generally LED for MM or laser for SM) and wavelength (850, 1300, 1550 nm) that will be used on the fiber optic cable you are testing.

Which Loss Measurement Wavelengths? | Kingfisher International

It has been standard practice for many years to perform single mode fiber tests at 1550 nm (in addition to 1310 nm), to help find identify cabling stress points. Typically, a kinked cable may pass at 1310

How to Test a Fiber Optic Cable: Best Methods & Tools

Using a visible light source tests the continuity of fiber optic cabling. Because fiber optic transmissions work in the infrared portion of the electromagnetic spectrum, they are invisible to the

Comparing OTDR Wavelength Responses

Commonly used wavelengths include: 850 nm and 1300 nm: Primarily used in multimode fibers for short to medium distances. 1310 nm and 1550 nm: Standard for single-mode fibers, suitable

Major Recommendations: Optical

G.652The characteristics of a single-mode optical fibre and cable with zero-dispersion wavelength around 1310 nm, but which can also be used in the 1550 nm region.

New commented version of standard for optical fibres measurement

There are three ways to measure this property: Method A measures the cut-off wavelength using a 22-metre-long piece of fibre that''s not in a cable. Method B does the same thing but with a 22

Guidelines Corning Recommended Fiber Optic Test

Figure 2). The wavelength(s) used for acquiring the OTDR traces should be the same as the wavelengths used for the Tier. 1 testing. Tier 2 testing is listed as optional in TIA-568.3-D, but this

The FOA Reference For Fiber Optics

Fiber Optic Testing Testing is used to evaluate the performance of fiber optic components, cable plants and systems. As the components like fiber,

How to Test Fiber Optic Cable | Equal Optics

Use the Correct Wavelength Fiber networks can carry various wavelengths. You should perform testing using the wavelength of your network

Comparing OTDR Wavelength Responses
