OPGW optical cable pulling speed

Overview

A light pilot line is first pulled through the traveler sheaves; the OPGW is then pulled using a tensioner and puller set that maintains constant load. Maintain smooth pulling speed (≈ 2 to 5 km/h). For larger diameter OPGW cables where 70 x OD exceeds 60" (~1. Please consult AFL in such cases. NOTE: Refer to Table 2 for. Professional-grade Optical Cable Traction Equipment with 2KN force, 50-60m/min speed, and 5mm-45mm range for safe and efficient fiber optic cable installation. Bullwheel diameter ≈ 70. Therefore, specific components and machinery are used for the OPGW cable: pullers, tensioners, anti-twisting counterweights, swivels, pulling grips, pulley-blocks, self-gripping clamps, pulling ropes, pulling cables, etc. – Length of each drum The. ation on high voltage overhead power lines. The cable contains optical fibers for data transmission and telecom purpose optical fiber unit and the cable armoring. Furthermore this specification contains information concerning the quality assurance during manufacturing, the final accepta ce tests. Pull must not exceed the maximum pull-in tension = 20% RBS! Must confirm with the cable supplier! Some allow only 15% RBS or less Pull also must not exceed the maximum allowed horizontal line angle change! Let's look at each.
